**Subject:** Quesiton about CZARA guidance on ag

I'm studying the guidance on ag and would appreciate your perspective on Chapter 2 (management Measures for Agriculture Sources), Section 1, introduction, subsection F which states in part (underlining added):

"F. Pollutants That Cause Agricultural Nonpoint Source Pollution

The primary agricultural nonpoint source pollutants are nutrients, sediment, animal wastes, salts, and pesticides. Agricultural activities also have the potential to directly impact the habitat of aquatic species through physical disturbances caused by livestock or equipment, or through the management of water."

**Non-Responsive**

**Non-Responsive**

It isn't clear to me, however, how habitat impacts relate to pollutants and pollution.
